Creating safe environments for all applications with a unique anti-slip surface

Toronto, March 2016 – LSI Floors is a leader in luxury vinyl tiles and planks for high performance applications in commercial, healthcare, retail and hospitality facilities; all environments where public safety is of critical concern and all applications where slips and falls account for a significant percentage of personal injuries.

LSI vinyl flooring is durable, impervious to water, resists stains, and is simple to maintain and disinfect while easily carrying the load of heavy equipment. The dimensional stability built into each LSI tile and plank ensures the product will not shrink and will comfortably live up to the life-cycle of any installation. LSI has also engineered the surface of the product to include an anti-slip technology.

Standard on all LSI flooring products is a UV-cured microscopic glass bead top surface. This is the latest in slip-resistance technology with a DIN R9 rating. This rating exceeds the standards for public spaces. For enhanced safety LSI achieves a rating of R10 by a microscopic surface texturing and a proprietary application method. Combined these treatments improve the tile's slip resistance when it counts most - under wet conditions. This unique technology allows LSI to meet or exceed all ASTM standards including the incline test which verifies slip resistance on an incline or a ramp situation. The slip resistance on these tiles actually improves under wet conditions. It is tested with soap, water and bare feet. The LSI tiles come out ahead.

LSI. Expressive Floors™ for creative minds.
LSI. Protective Floors™ for safer environments.
